Terminal To-Do List Application

Submission Status

NOT_STARTED

Beginner Project — Focus: Arguments, Files, Basic Bash Logic

Project Overview

You will build a simple command-line To-Do List application using Bash.

The program will store tasks in a text file and allow the user to **add**, **list**, and **delete** tasks.

Learning Objectives

By completing this project, you will learn to:

Work with text files in Bash

Use command-line arguments

Use conditional statements (`if`, `case`)

Append, read, and remove lines in files

Display useful feedback to the user

Requirements

Create a script named **`todo.sh`** that supports the following commands:

1. Add a New Task

```
./todo.sh add "Buy milk"
```

Appends the task text to a file named **tasks.txt**

Creates **tasks.txt** if it doesn't exist

2. List All Tasks

```
./todo.sh list
```

Displays all tasks with line numbers

Example:

```
1. Buy milk
2. Finish homework
```

3. Delete a Task

```
./todo.sh del 2
```

Removes task number 2 from the file

If the number doesn't exist, display an error message

Constraints

Do **not** use external programming languages — only Bash commands.

Do not overwrite the whole file manually; use tools like `sed` where appropriate.

Input must be validated (e.g., check if a command is provided).

Suggested Steps

Create **tasks.txt** if missing

Parse the first argument using a `case` statement

Implement `add` using `echo "..." >> tasks.txt`

Implement `list` using `nl` or manual numbering

Implement `del` using `sed -i` or by rebuilding the file

Add error messages for invalid commands

Minimum Expected Output

A working script that:

Accepts arguments

Stores tasks

Lists tasks

Deletes tasks

Handles errors gracefully

Stretch Goals

Color-coded output

Prevent duplicate tasks

Add a timestamp to each task

Add a command like:

```
./todo.sh clear
```

Project Checks

- Is the folder structure correct
- Are all linter tests passing
- Is the branch name correct
- Was the pull request created correctly
- Are all related changes included in this Pull Request
- Well indented code
